

What is Data Science

- Data Science is a multi-disciplinary field that uses scientific methods, processes, algorithms and systems to extract knowledge and insights from structured and unstructured data.
- Data science is unifying the statistics, data analysis and machine learning

Pandas Library

- Pandas is a software written for python for data manipulation and analysis.
- It offers data structures and operations for manipulating numerical tables.
- Some of its features:
 - Dataframes
 - Reading and writing into the files
 - Column insertion and deletion
 - Data filtration
- import **pandas** as pd

Data frames

- Pandas is known for its data frames
- A data frame is a two dimensional data structure.
- Data is stored in tubular fashion, as rows and columns.

Id	name	marks
190	Ahmad	89
191	Saeed	80
192	Naeem	92

```
1 import pandas as pd
2
3 data=[["Ahmad", 20],["Saeed", 24],["Riaz", 23]]
4
5 df=pd.DataFrame(data, columns=['Name', 'Marks'])
6 print (df)
```

	Name	Marks
0	Ahmad	20
1	Saeed	24
2	Riaz	23

Numpy Library

- NumPy stands for Numerical Python, is a library consisting of multidimensional array objects and routines to process data.

```
1 import numpy as np
2 a=np.array([[1,2,3],[2,4,6]])
3 print(a)
```

```
[[1 2 3]
 [2 4 6]]
```

Pre- Requisite

- Pip install scikit-learn / pip3 install scikit-learn
- [Afghanistan Population and Data Form Word Bank.](#)
- <https://data.worldbank.org/indicator/SP.POP.TOTL?locations=AF>
- <https://www.kaggle.com/tanuprabhu/population-by-country-2020>

Linear Regression

- The Linear regression is a linear approach to modeling the relationships between two variables.
- If there is one explanatory variable it is called Single Linear Regression (SLR)
- SLR is used to estimate the mean line of the different data and predict the future data
- from `sklearn.linear_model` import `LinearRegression`

Predicting the Future information

- To predict the future information on any data, we need the following:
- Get the data
- Clean the data (preprocessing)
- Create or Build the model
- Predict the future information
- Plot the data

Import the libraries

```
1 import matplotlib.pyplot as plt
2 from matplotlib.ticker import FormatStrFormatter
3 import pandas as pd
4 import numpy as np
5 from sklearn.linear_model import LinearRegression
6
```

Read the data into Dataframe

```
8 csv_file="population.csv"
9 df=pd.read_csv(csv_file,skiprows=4)
10 print(df)
11
```

1	Data Source	World Development Indicators

Cleaning the data

- The data should be cleaned to reduce the chances of errors:
- First, print the columns to remove useless ones:

```
1 print (df.columns)
```

```
Index(['Country Name', 'Country Code', 'Indicator Name', 'Indicator Code',  
      '1960', '1961', '1962', '1963', '1964', '1965', '1966', '1967', '1968',  
      '1969', '1970', '1971', '1972', '1973', '1974', '1975', '1976', '1977',  
      '1978', '1979', '1980', '1981', '1982', '1983', '1984', '1985', '1986',  
      '1987', '1988', '1989', '1990', '1991', '1992', '1993', '1994', '1995',  
      '1996', '1997', '1998', '1999', '2000', '2001', '2002', '2003', '2004',  
      '2005', '2006', '2007', '2008', '2009', '2010', '2011', '2012', '2013',  
      '2014', '2015', '2016', '2017', '2018', '2019', 'Unnamed: 64'],  
      dtype='object')
```

```
1 useless_cols=['Country Code', 'Indicator Name', 'Indicator Code', 'Unnamed: 64']  
2 df.drop(columns=useless_cols, inplace=True)  
3 print(df.columns)
```

Read the specific row of data

```
1 record=df.loc[[1]]
2 print(record)
```

	Country Name	1960	1961	1962
1	Afghanistan	8996973.0	9169410.0	9351441.0

```
4 years=record.columns.tolist()[1:]
5 years=years[0:-1]
6 print(years)
7
8 population=record.values.tolist()[[0][0]]
9 population=population[1:-1]
10 print(population)
```

[1 rows x 61 columns]
['1960', '1961', '1962', '1963', '1964', '1965', '1966', '1967', '1968', '1969', '1970', '1971', '1972', '1973', '1974', '1975', '1976', '1977', '1978', '1979', '1980', '1981', '1982', '1983', '1984', '1985', '1986', '1987', '1988', '1989', '1990', '1991', '1992', '1993', '1994', '1995', '1996', '1997', '1998', '1999', '2000', '2001', '2002', '2003', '2004', '2005', '2006', '2007', '2008', '2009', '2010', '2011', '2012', '2013', '2014', '2015', '2016', '2017', '2018', '2019', '2020']

[8996973.0, 9169410.0, 9351441.0, 9544410.0, 9744410.0, 9944410.0, 10144410.0, 10399926.0, 10637063.0, 10893776.0, 11150000.0, 11406000.0, 11662000.0, 11918000.0, 12174000.0, 12430000.0, 12686000.0, 12942000.0, 13198000.0, 13454000.0, 13710000.0, 13966000.0, 14222000.0, 14478000.0, 14734000.0, 14990000.0, 15246000.0, 15502000.0, 15758000.0, 16014000.0, 16270000.0, 16526000.0, 16782000.0, 17038000.0, 17294000.0, 17550000.0, 17806000.0, 18062000.0, 18318000.0, 18574000.0, 18830000.0, 19086000.0, 19342000.0, 19598000.0, 19854000.0, 20110000.0, 20366000.0, 20622000.0, 20878000.0, 21134000.0, 21390000.0, 21646000.0, 21902000.0, 22158000.0, 22414000.0, 22670000.0, 22926000.0, 23182000.0, 23438000.0, 23694000.0, 23950000.0, 24206000.0, 24462000.0, 24718000.0, 24974000.0, 25230000.0, 25486000.0, 25742000.0, 26000000.0]

Plotting the current years

```
1 import matplotlib.pyplot as plt
2
3
4 plt.plot(years, population)
5
6 plt.xlabel("Years")
7 plt.ylabel("Population")
8 plt.xticks(rotation='vertical', fontsize=6)
9
10 plt.show()
11 %matplotlib inline
```

Train the Model and Predict

Train the Model:

```
1 regressor=LinearRegression()
```

```
1 regressor.fit(np.array(years).reshape(-1,1), population)
```

Predict the Future:

```
1 future=round(regressor.predict(np.array([2050]).reshape(-1,1))[0])  
2 future
```

45547749.0

From 2020, 2050

```
1 future=[]
2 for years in range(2020,2050):
3
4     predict=round(regressor.predict(np.array([years]).reshape(-1,1))[0])
5     future.append(predict)
6 print(future)
7
8 |
```

```
[32013794.0, 32464926.0, 32916058.0, 33367190.0, 33818321.0, 34269453.0, 347205

743222.0, 44194353.0, 44645485.0, 45096617.0]
```

Add the new data to the previous list

```
1 for values in future:  
2     population.append(values)
```

```
1  
2 for year in range(2020,2050):  
3     years.append(year)  
4
```

```
1 plt.plot(years, population)  
2 plt.show()
```

Thank You!
